# Visual Evidence

## One observed moment

### Image evidence prompt

Submit one original screenshot or still of your Case Study 1 Atari game. Caption it with the title, version or platform when known, the scene shown, and its source. A relevant image from your first case study may be reused.

**Requirements and potential deductions**

- The image shows the original scene used for this redesign. (up to -0.5 points)
- The caption identifies the selected Atari game, scene, and image source. (up to -0.5 points)

Caption: Game: Battlezone (Atari 2600); Scene depicts the player firing at an enemy tank, with an enemy UFO off to the side; Source: I took the screenshot at https://atarionline.org/atari-2600/battlezone

# Visual Redesign

## Improvement goal

### Response prompt

Identify one visual problem in the original scene and explain the mood or player experience your redesign should support. Refer to a specific detail in the original image.

**Requirements and potential deductions**

- Identifies a visual problem using a specific detail from the original scene. (up to -0.75 points)
- Explains the intended mood or player experience of the redesign. (up to -0.75 points)

### Submitted response

A visual problem in the original scene would be how there is no color difference between the player and the enemy's projectiles both are White. While obvious whose is whose when in play, from a still screenshot, there is no way of knowing whether the sh belongs to an enemy or the player. Another visual problem is how the UFOs, the enemies that reward bonus points when shot, are harmless to the player, are colored RED. This can be seen as a more threatening color than the enemy Tanks' BLUE, whic cool color in comparison, yet is painted on an enemy that can harm the player.

## Revised palette

### Response prompt

List your proposed colors and their roles, including any neutrals. Explain why this palette size and a named color relationship suit your improvement goal, and how contrast makes an important element stand out. Color names or swatches are sufficient; exact color codes are optional.

**Requirements and potential deductions**

- Identifies the proposed colors and what each is used for. (up to -0.5 points)
- Justifies the palette size and a named color relationship using the improvement goal. (up to -0.75 points)
- Explains a contrast choice that makes an important element stand out. (up to -0.75 points)

### Submitted response

Proposed Colors of a Palette Size of 9:
Neutrals:
- Dark Gray - Background Mountains and Player Treads and Barrel
- White - UI and Player Projectiles
Cool Colors:
- Light Blue - Background Sky
- Light Green - Terrain
- Dark Green - Player Tank
- Purple Blue - UFOs
Warm Colors
Yellow - Midway Distance Marker, Fighters
Red Orange - Far Distance Marker
Red - Enemy Tanks, Enemy Projectiles

I chose this palette size as it provides enough variety to distinguish the player from the enemies on the field, the background, a foreground of the play area. The main difference is that enemy tanks are now colored Red as to help convey to the player that are an active threat, while the mysterious UFO that rewards bonus points is now a cooler Purple Blue. A named color relations here could be between the terrain (Light Green) and the dangerous enemy tanks (Red) with a Complementary Relationship, he the player visually distinguish the two. Another relationship is the warm–cool contrast between the red enemy tanks and the pu blue UFOs. This contrast aims to give the dangerous tanks greater visual prominence than the harmless UFOs, encouraging p to prioritize actual threats.

## Redesigned scene

### Image evidence prompt

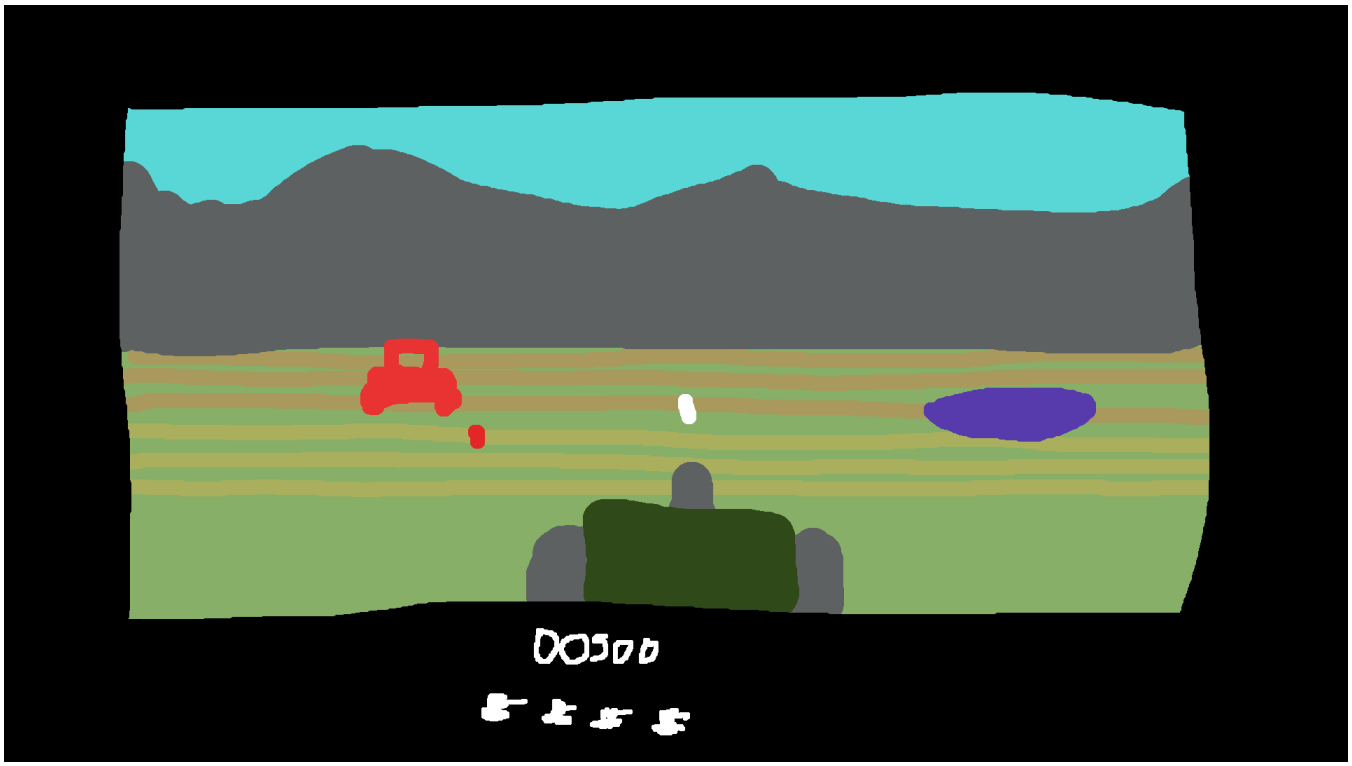

Submit a colored sketch, annotated recoloring, or mockup of the same scene using your proposed palette. Include a gameplay element and an interface or state indicator. Keep an important state understandable without color alone, using a label, shape, or icon. Caption

the image to identify the scene and your changes.

**Requirements and potential deductions**

- The redesign applies the proposed palette to the same scene's gameplay element and interface or state indicator. (up to -1.25 points)
- An important state has an understandable label, shape, or icon in addition to its color. (up to -1.25 points)

Caption: The Image depicts hostile enemy tank and UFO off to the sides of the player. The white projectile belongs to the player, while the red one belongs to the enemy tank. The yellow and red-orange lines on the field help display distance to help the player know how far to aim for or how close an enemy projectile is to hitting them.

## Look and feel decision

### Response prompt

Explain one visual change beyond the palette, such as composition, interface layout, character shape, or an animation you would add. Connect it to a relevant Chapter 6 concept from vision, interface, ambience, or storytelling and explain its intended effect on the player. Describe motion in words if your sketch cannot show it.

**Requirements and potential deductions**

- Connects a specific visual change beyond the palette to a relevant Chapter 6 concept. (up to -0.75 points)
- Explains how that change would affect the player's experience. (up to -0.75 points)

### Submitted response

One visual change beyond palette that I would add would be restoring the original arcade version of Battlezone's point of view the tank's actual sight instead of the third person view in the Atari 2600 version. This would help bring establish the Interface th player is truly controlling a tank, as it would also make the marker that appears on the top of the screen that changes color whe you're aiming at an enemy make sense in a transparent sense as instead of a mysterious floating point of reference, it now ma sense for it to be there as it would be a part of the Gunner's sight that the player is actually looking through.

## Evaluate the redesign

### Response prompt

Compare your redesign with the original scene. Explain how the revised visuals work together to address your improvement goal while keeping the game's core actions and rules. Refer to a specific difference visible in the two images.

**Requirements and potential deductions**

- Evaluates the combined effect of the revised visuals on the improvement goal using a specific before-and-after difference. (up to -0.75 points)
- Explains how the original core actions and rules remain intact. (up to -0.75 points)

## Submitted response

My revised visuals focuses around recoloring the enemies to help establish which of the two is a greater threat to the player, w not compromising the general gameplay loop. Since the revised Red Tank establishes a more dangerous aura compared to th original Blue Tank, and the Purple Blue revised UFO is more cool and non-threatening color compared to the original Red UFO should hopefully help guide the player towards targeting the tanks over the UFOs first. The original core actions and rules rema intact as the tanks are only emphasized in danger while the UFOs now have a more "rewarding" look for players to chase after dealing with immediate threats.
